Sea Snake Bite Treatment

- Use the pressure immobilization technique for a sea snake bite.
  - The affected extremity should be wrapped with a bandage in a style similar to wrapping a sprained ankle.
  - Firmly bind the limb, but do not block the circulation. The fingers and toes should remain pink.
  - Leave bandages intact until medical personnel can administer treatment.
- Avoid movement.
- CPR may be necessary.
- Do not cut into the wound or apply suction.
